INTRODUCTION

The commercial fishery in the Ontario waters of Lake Huron is managed by the Ontario Ministry of Natural Resources (OMNR), Upper Great Lakes Management Unit in cooperation with native and non native commercial fishermen throughout the lake. In order to assist in describing and managing this fishery, this report of commercial fishing activity is produced annually to summarize the commercial fishing activity the over past year and provide a short historical record of commercial data.

Licensed commercial fishermen in Lake Huron are required to report effort, catch and harvest information on a daily basis. In addition, commercial fisheries operating under fishing agreements are required to report similar information to the OMNR on an annual basis. These data provide the basis for the summaries found in this report and are also used in stock assessment analyses.

This report contains commercial summaries for the whole lake, for each of the three basins, and for individual Quota Management Areas (QMAs). It also contains commercial fishing statistics (harvest, effort, targeted CPUE, quota, % quota taken) for the major fish species in each of the QMAs for the period 1991 to 2008. In locations where more than one fishing gear was employed, results are given for each gear type used.

Commercial fishing activity on Lake Huron is regulated using Individual Transferable Quotas. This method allocates a maximum harvest for all quota managed species to all licensed and controlled fisheries within a specified quota management area (Figure 1). The sum for all allocations is the total quota for a particular species in a QMA. Not all fish species in Lake Huron are quota managed. When these species are caught commercially, they are included in this report but with no associated quota value.

Every attempt has been made by all parties involved to ensure the data presented in this report are complete. The Upper Great Lakes Management Unit continues to audit and update historical commercial fish information as required, which may be result in changes in historical data presented here. For 2008, all available commercial fishing information was used at the time of printing. If more information for 2008 comes to light after printing it will be included in future reports. This report should be considered the most up to date and correct when compared to previously published reports.

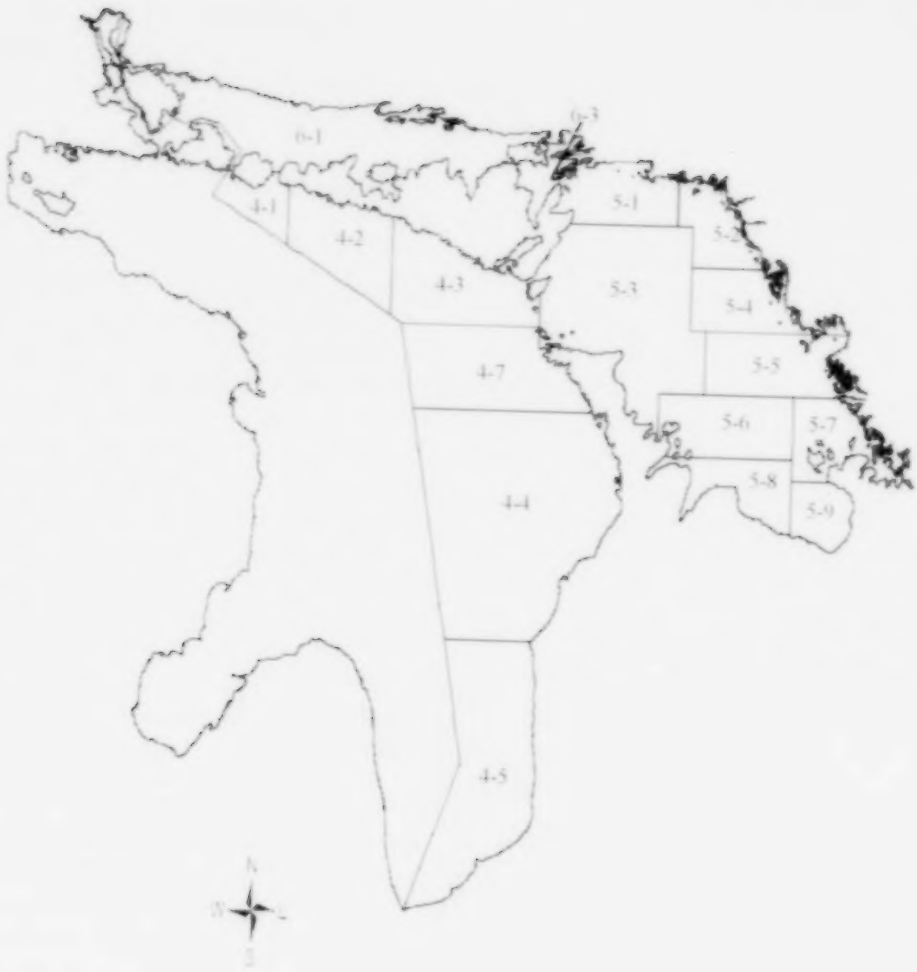

Figure 1. Quota Management Areas (QMAs) defined for managing commercial fish species in Lake Huron. Basins defined in this report include the Main Basin (4-1 to 4-7), Georgian Bay (5-1 to 5-9, and the North Channel (6-1 and 6-3).

DISCUSSION

The commercial fishery in 2008 was comprised of 37 licensed commercial fisheries and 8 Aboriginal commercial fishing agreements. The number of fisheries in Lake Huron did not change from 2007, but has declined over previous years. The majority of the fisheries continued to be gill net fisheries with 2 trap net fisheries, one in southern Lake Huron and the other in the northern main basin, off the south western shore of Manitoulin Island.

Total gillnet fishing effort for all species in 2008 was 14 987 km of net, a slight decrease from 2007. Effort in individual QMA's varied both up and down, but none changed dramatically in 2008. Targeted total gillnet effort decreased for major species including lake whitefish and yellow perch, but increased for walleye. Round whitefish had a substantial decline in effort. Trapnet effort decreased in 2008 to 966 trapnet efforts. There were declines in all of walleye, yellow perch and lake whitefish targeted trap net efforts.

A total of 2.568 million kg of fish were commercially harvested from Lake Huron in 2008 with an approximate landed value of $6.7 million. Commercial harvest continued to be dominated by lake whitefish in 2008 (Table 1). Lake wide lake whitefish harvest increased 24% from 2007. This was a change from the previous trend of generally declining lake whitefish harvest since the late 1990's.

Lake trout were the second highest component of the total harvest followed by yellow perch and then walleye. Lake trout harvest declined about 6% from 2007, while walleye harvest declined by approximately 2% as did yellow perch by 4%. Lake herring harvest declined substantially by almost 45%. Deepwater chub harvest was zero in 2008 continuing the trend of very low chub catch and harvest throughout the lake for a number of years.

GLOSSARY OF TERMS

Catch - the total weight of all fish captured in commercial fishing gear. This includes harvested fish as well as any fish that are reported released alive or discarded. The term "targeted catch" refers to catch data that are specific to fishing effort directed at a single species. Catch is derived from commercial fishers' catch reports and where necessary, from records of fish purchases by wholesalers.

CPUE - Catch Per Unit of Effort. For most species CPUE equals targeted catch divided by targeted effort for that species using a single gear type (gill net or trap net). For lake trout, effort used included all targeted lake whitefish effort plus any lake trout targeted effort. For lake herring, only lake whitefish targeted effort that caught lake herring was used.

Effort - the amount of fishing gear deployed while targeting a specific species, expressed in kilometres of net for gill nets and number of net lifts for trap nets.

Harvest - the total weight of all fish that are landed, sold, or taken home and subsequently reconciled with the commercial quota. Harvest is derived from commercial fishermen's catch reports and where necessary from records of fish purchases by wholesalers.

Percent Quota Taken - the harvest expressed as a percentage of the quota.

Quota - the total allowable commercial harvest for a species within a quota management area in a given year. This is the sum of quota specified on issued commercial fishing licenses, allowed harvests under commercial fishing agreements, and any Crown held quota considered available to be harvested in a given year. Lake trout and lake whitefish quotas may include temporary allowances in addition to quota in some years. This is sometimes referred to as issued quota.

Value - the estimated dollar value of fish sold at the first point of sale (wholesale value). Value is derived from fish price information provided by the Ontario Commercial Fisheries Association (OCFA) and the harvest data.

LAKE HURON
